

AI Automation Portfolio

Synthetic technical proof pack

Owner identity	WEN JING
Artifact type	Synthetic technical demonstration
Verified test result	26 automated tests passed / 26 executed
External integrations	None; credential-free local execution
Client data	None

Synthetic technical demonstration. Not a client case study.

This repository demonstrates workflow logic that was run locally against safe fixtures. It does not claim production deployment, customer results, revenue, prior employment, education, or client work.

What was verified

- required-field validation and readable field-level errors
- email normalization and deterministic duplicate suppression
- fit and urgency classification with explicit routing
- bounded transient retry behavior
- credential-free sample workflow output
- 26 passing automated tests across the original suite, edge cases, and the sample workflow

Featured workflow

The sample receives lead-like records from a JSON fixture, validates the required fields, normalizes values, removes duplicate normalized emails, classifies fit and urgency, and routes the result to a simulated CRM automation path or human review.

Inputs

Required: lead_id, email, company, need. Optional: urgency, budget, source. The checked-in input has three synthetic records: one accepted, one duplicate, and one rejected.

Outputs

The run produced one accepted record routed to CRM_AUTOMATION, one duplicate suppressed by normalized email, one rejected record with an invalid email error, and a downstream status of COMPLETED_AFTER_RETRY_2.

Failure paths and boundary

- No network request is made by the demo.
- No n8n, CRM, LLM provider, payment system, or production account is connected.
- No API key, token, private path, client record, or MERVYX material is included.
- Exhausted retry behavior remains visible instead of being treated as success.

Reproduction record

The following commands were run from the repository root after the portfolio files were assembled:

```
npm test
npm run demo
```

Test result

Metric	Observed result
Tests	26
Passed	26
Failed	0
Skipped	0
Demo input records	3
Accepted / duplicate / rejected	1 / 1 / 1
Downstream simulation	COMPLETED_AFTER_RETRY_2

How to inspect

Run `node demo/run_demo.mjs` to inspect the deterministic sample output. Run `npm test` to rerun the 26-test suite. Source, fixtures, tests, and the credential-free workflow representation are included alongside this evidence file.
